

Slate & the environment

Slate is the green choice.
The properties of natural slate come straight from mother nature.

Natural

Slate is an environmentally friendly product. It is 100% natural and hand worked by skilled crafts people with no chemical products or additional treatment.

Energy

Natural Slate production is much more efficient than other building materials, resulting in less energy emissions. As a natural rock, there is no kiln work unlike a concrete or clay product. This combined with the extreme longevity of slate results in a smaller carbon footprint.

Lifespan

An ecological and reusable option, slate has a long lifespan. Once on the roof, premium slate lasts up to 75 years or longer. It withstands all weather conditions and protects your home.

Design

The longevity and resilience of slate makes it a worthwhile investment. Not only does it enhance the value of a property but it saves wasting building materials in the future. Building materials with short lifespans have the most harmful impact on the environment because of having to replace them often. Save your pocket and the planet.
